-1. FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete LGP-1. It stimulates both the differentiation and proliferation of myobiasts. It also stimulates amino wrid uptake and protein synthesis in massiv and short
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       van Leeuwen I.S., Teske E., van Garderen E., Rutteman G.R., Moi J.A.; "Extrapituitary growth hormone expression in the dog is initiated at the normal pituitary transcription start site in the mammary gland and at multiple upstream sites in lymphoid cells."; Submitted (MAR-1997) to the EMBL/GenBank/DDBJ databases.

FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete 16F1. It stimulates both the differentiation and proliferation of i, blasts. It also stimulates amino acid uptake and protein synthesis in muscle and other tissues. SUBCENTICLER LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

chimeric profein acts as an intramolecular chaparone (IMC) for the linsuin precursor, enabling it to fold correctly. A cleavable peptide linsuin precursor enabling it to fold correctly. A cleavable peptide of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin via an hGH-proinsulin chimeric protein can provide human insulin with correctly linked cystein cridges with fewer necessary procedural steps, and hence resulting in a higher sequences from intracellular degradation by a microorganism host, but also promote the folding of the fused issulin precursor, facilitate the colour, in the folding of the fused issuling precursor, facilitate the colour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             interactions among the tuston proteins, thus a leaving fielding of the fused hash as processor a recentrally used that can entrations, the procedural steps of cyanamic behavior and related puritized in a respect to this telefinities and related puritized for steps can thus be obtained a grand with the use of high cyanecutations of mercaptan or the use of hydrophobic
                                                                                    sequence represents an N-terminal 1 agment of human growth hormone
                                                                                                            (ACH) which is a component of a chimeric protein (AAY42861) which also contains a human insulin precursor (AAY4289). The AGH portion of the

```
This invention describes nove; human auti-angiogenic peptides derived from 19 to 150 consecutive amino acids selected from the N-terminal end of from 19 to 150 consecutive amino acids selected from the N-terminal end of human placental hardogen (http://p. human growth hormone (http://p. growth formone variant (hdHvV), or human production, such peptides (i) inhibit capillary endothellal cell proliferation and organisation (ii) inhibit capillary endothellal cell proliferation and organisation (ii) inhibit conferences: in chick chokindal attoic merbrane and (iii) binds to attoin the base of the capillary endothellal cell proliferation and organisation of programmes and products and products and products of the capillary of placental vascularisation during programs are protected and production or growth in a patient or for a subject, for inhibiting tumour formation or growth in a patient or for codulating variant sation of a patient's placental in particulary the codulation variation variations and reprosorous malformation, arthritic such as rheumatoid arthritis, attended proliferative retinopathy such as those occurring or harmony manual proportiate vascular sation in wound healing on harmony proliferative retinopathy such as those occurring or harmony proliferative retinopathy such as diabetic continous, avoitis, and reproductive disorders such as follicalar and tumour. Socilasis, pyoyenic glaucoma, retrolental fibroplasia, schedering variation of conditional levels of N-terminal Iraques can be used as contraceptive agents. DNA conditional levels of N-terminal Iraques of both with pro-eciampsia, intraductine growth retardation, and placental
                                                                                                                       New asti-anglogenic peptides - comprise N-terminal fragments of
                                                                                                                                           human placental lactogen, human growth hormone, growth hormone

```
Human growth hormonic sequent, used at the N-terminal of a fusion profess, which contains a thrombin recognition site, and himan beta nerve growth factor (beta-NGF) at the Citerminal. Heta-NGF can be used to control geriatric dementia and other nervous disorders, and can be released from the fusion protein by incubation with thrombin (see AAN90577-8, AAP91034, AAP91299).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MEPTIPLSRLFUNAMLRAHRLHULAFDTYQEFEEAYIPKEQKYSFLUNPOTSLSFSESIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human nerve growth factor gene encoding fusion profein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PARKEX PARKEY PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Niteriniai tradment of human grawt, harmone (http:) of the sequence given in AAY42856, a cleavable peptide linker (AAY42857), and a human masuin of the precursor comprising insulin A and B chains (AAY42859). The http portion of the chimeric protein acts as an intramolecular chaperone (LMC) for the insulin precursor, enabling it to foid correctly. The cleavable of the insulin precursor neabling it to foid correctly. The cleavable of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin as high profinsulin chimeric protein can provide human insulin with contributing in a higher yield of human insulin with contributing in a higher sequences from intracellular devradation by a microorganism host, but also product the folding of the fused insulin precursor, inclinate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               interactions among the fusion proteins, thus allowing folding of the fused instill in precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative suphtholysis and related putitication steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0

                                                                                The invention consists of a vector contq. a fusion protein which is formed by inquting, downstream of a promoter, hGH or a deriv. (pret. formed by subtstn. of Met.-14 with Leu) and a foreign protein. Stability of the vector in the host is greatly increased so the protein yield is higher. hormone variant (hGH-V), or human prolactin. Such peptides (i) inhibit capillary endothelial cell proliferation and organisation (ii) inhibit angiogenesis in chick chorioallantoic membrane and (iii) binds to at least one specific receptor which does not bind an intact full length hGH, hPL, prolactin or hGH-V. The invention also describes a method for diagnosing a probable abnormality of placental vascularisation during pregnaticy. The peptides can be used for treating an angiogenic disease in a subject, for inhibiting tumour formation or growth in a patient or for
                                                                                                                                                                                          peptidos can be used for proventing or treating e.g. malignant tumours, anglofibroma, arteriovenous mallormation, arthritic such as rheumatoid arthritis, atheroselerotic plaques, corneal graft neovascularisation, delayed wound healing, proliferative retinopathy such as diabetic retinopathy, macular dogeneration, granulations such as those occurring in haemophilic joints, inappropriate vascularisation in wound healing such as hypertrophic sears or begind a reevascular glaucoma, ocular tumour, uveltis, non-union tractures, usier wheer syndrome, psoriasis, pyoqenic alauroma, turnoma, vascularistandi throplasia, scleroderra, solid tumours, feukascia, and reproductive disorders such as foilieu ar and luteal cysts and choricoarcinoma, they can also te used as contraceptive agents. DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and choriocarcinemd, they can also be used as contraceptive agents. DNA encoding the peptides can be used in gone therapy. The measurement of abnormal levels of Noterinal fragments of high higher, projectin or hPL can be used in assays for impairment of vascalar development associated with pre-eclampsia, intranterine growth retardation, and placental dystunction.
                                                                                                                                                                           modulating vascularisation of a patient's placenta. In particular, the

This invention describes novel human anti-angiogenic peptides derived from 10 to 150 consecutive amino acids selected from the N-terminal end of human placental lactogen (hPL), human growth hormone (hGH), growth

New anti-anglogenic peptides - comprise N-terminal fragments of human placental lactogen, human growth hormone, growth hormone variant or human prolactin

The purified protein is useful in a medicament for treating disorders of the nervous system, eg dementia. (Updated on 25-MAR-2003 to correct PF field.)

The polypeptide (AAPB1226) with somatomedin-like activity and the DNA (AANB1605) encoding it are claimed. A Met resicual gp. may be added to the Niterminal. The polypeptide acts on the bone structure of mammals, including humans, to promote bone growth. The polypeptide has high production rate and is easily extracted from bacterial culture medium and refined for use as a bone growth accelerator. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                        The protein is a direct translation of the upstream tryptophan promoter operator lacking its attenuation sequence and human becances sequence. The product may be efficiently expressed from a transformed E.coli expression system.

The specification describes a method of detecting an exogenously administered substance from a naturally occurring endogenous substance. The exogenous substance being tagged so that it fluoresces differently from the endogenous one at a surtable wavelength. The tagging may consist of one or more substitutions in tagged growth hormone selected from 640%, F52%, W86F, Y, L, I or V F63% or 113%. The method is used to distinguish between exogenously administered substances as compared to naturally occurring endogenous substances. Especially mentioned is the illegal misuse of growth substances by athletes or in domesticated farm animals e.g. cattle. The present sequence represents native finant growth hormone which may be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection; fluoresce; illegal misuse; growth substance; athlete; domesticated farm animal; cattle; human growth hormone.

```
The prosect invention describes a human erach harmone and and the 18th The and the 18th The are replaced respectively by Aspland From the 18th The and sequence of statual type human az king growth harmone (half) and which has a resistance adalost decomposition by thrombin. The present sequence represents the natural half. Also and the 14th has a resistance adalost the 18th The and the 140 hubbs are placed respectively by Asp. Pro and Ala in the amino acid sequence of natural type holf and which has a resistance amino acid sequence of natural type holf and which has a resistance preparation containing the above holf mut at as the active component. The mutant holf shows a nactivity approximately equivalent to that of natural type holf and solve the active component.
                                                                                                                                                                                                              A human growth hormone mutant - with equivalent activity to natural human growth hormone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            OTHER INFORMATION: Description of Artificial Sequence: Designated is OTHER INFORMATION: an amino acid sequence of MMPSp-MMPmp20-TEV-G-GH
Sequence 9, Application US/09929918
Patent No. US20020096678A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Roadyum, Vitaliy A.
APPLICANT: Slavehenko, Iryna Yu.
APPLICANT: Slavehenko, Iryna Yu.
APPLICANT: Slavehenko, Iryna Yu.
TITLE OF INVENTION: PRAGE-DEPENDENT SUPER PRODUCTION OF
TITLE OF INVENTION: BIOLOGICALLY ACTIVE PROTEIN AND PEPTIDES
FILE HEFERENCE: PHAGE-DEPENDENT SUPER PROTEIN AND PEPTIDES
CURRENT APPLICATION NUMBER: US/09/929,918
CURRENT FILING DATE: 2001-08-15
PRICK APPLICATION NUMBER: 09/318,288
PRICK APPLICATION NUMBER: 09/318,288
PRICK FILING DATE: 1999-05-25
NUMBER OF SEQ ID NOS: 11
SOFTWAKE: FastisEQ for Windows Version 4.23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
